

EXECUTIVE SUMMARY

Overview

This analysis examined 23,472 customer reviews collected from the company's women's clothing e-commerce platform to understand customer satisfaction, product performance, and the factors influencing product recommendations. The dashboard analyzed key metrics including customer ratings, recommendation behaviour, product classes, departments, age groups, and review distributions to identify patterns that can support strategic business decisions. The objective was to determine what customers value most, identify underperforming product categories, and provide actionable recommendations to improve customer satisfaction and increase product recommendations.

Key Findings

1. Overall customer satisfaction is high.

Customers gave an average rating of 4.20 out of 5, indicating that most shoppers are satisfied with their purchases. The ratings distribution also shows that 5-star reviews (13.12K) dominate customer feedback, followed by 4-star reviews, while very few customers gave ratings of one or two stars.

2. Customer recommendations increase significantly with higher ratings.

The dashboard clearly shows a strong relationship between product ratings and recommendations. Only 1.9% of customers recommended products rated 1 star, whereas 99.81% of customers who gave a 5-star rating recommended the product, demonstrating that customer satisfaction directly influences product advocacy.

4. Customer satisfaction is consistent across age groups.

Average ratings across all age groups ranged narrowly between 4.14 and 4.29, indicating that the company's products appeal consistently to customers regardless of age, with the 18–25 age group providing the highest average rating.

5. Certain product classes require immediate attention.

The lowest-rated product classes include Trend, Sweaters, Swim, Dresses, Blouses, Outerwear, and Knits, with recommendation rates ranging between approximately 74% and 82%, significantly lower than the company's overall recommendation rate of 82.23%.

Recommendations

- 1. Prioritize improvements in the Trend department and its lowest-rated product classes.** Conduct detailed analysis of customer review text to identify recurring issues related to quality, sizing, fit, or design, and implement targeted product improvements.
- 2. Replicate best practices from high-performing departments.** Analyse the product design, quality standards, and customer preferences that contribute to the success of the Bottoms, Intimate, and Jackets departments, and apply these insights to weaker-performing categories.
- 3. Strengthen customer engagement through review-driven marketing.** Since highly rated products are overwhelmingly recommended, prominently feature top-rated products and verified customer reviews on product pages to build trust, improve conversion rates, and encourage additional customer feedback.
